

GIP

External High Inspection Non-Piggable Lines (sub-sea ready)

GIP DETAILS:

Externally mounted MFL inspection tool for non-piggable pipelines such as tank farms, piers, refineries, chemical plants, as well as very short runs where ILI tool runs would not be cost-effective. Also an effective tool to precisely locate internal or mid-wall defects detected by ILI tools without removing pipe coating in the process of data prove up.

GIP can be used in sub-sea applications with the same results.

Data quality is monitored on-line real time to avoid reruns. Severe defects may be marked on-the-fly.
